

WARNING: AREVA AT WORK!

Dear European Nuclear Energy Forum delegate,

Combating the climate crisis demands forward thinking. Creating a future which is highly energy-efficient and powered by non-polluting, renewable forms of energy. Certainly not a step back into a bygone era where the failed promise of nuclear power was of electricity “too cheap to meter”.

The past three years of haphazard experience with AREVA’s ‘European Pressurised Reactor’ should be sufficient to alert prudent governments and investors to the risks of even the newest reactors.

And to the comparative advantages of clean sources of energy that are cheaper and don’t generate radioactive waste that remains dangerous for thousands of years.

Nor does clean energy mean becoming dependent on a foreign government - the French State, in the shape of AREVA – for nuclear fuel and technology. (Plus only half a dozen countries - some in unstable regions - which produce the vast majority of the world’s uranium). Honestly, is that ‘energy security’?

But for those governments and potential investors that, despite these words of caution, are foolhardy enough to place their energy destiny in the hands of AREVA, Greenpeace is pleased to offer its “EPR SURVIVAL KIT”.

We would also like to propose a range of responsible and effective measures against climate change which better meet national and commercial energy needs and the interests of citizens and customers.

Turn your back on the past! Join with us in delivering the true energy revolution which can overcome climate change and meet the needs of the many who are still unable to enjoy the benefits of electricity.

Have a nice day!

Your friends at Greenpeace.
